

PERFORMANCE TESTING

Team ID: SWTID-2026-8434
Project Name: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Step 1: Testing Overview

Field	Details
Testing Tool Used	Apache JMeter
Type of Testing	Load Testing
Target Module / API	ServiceNow Standard Laptop Service Catalog and Flow Designer workflow
Test Environment	ServiceNow Development / Test Instance
Test Date	15 March 2026

Testing Objective

The purpose of performance testing is to evaluate the behaviour of the automated Standard Laptop procurement workflow under expected user load. The workflow is designed to create a Catalog Task after approval and assign it to the Hardware group for laptop configuration.

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Single user places a Standard Laptop request	1	60	Request should be processed successfully
2	Multiple users place Standard Laptop requests simultaneously	10	120	Requests should be processed without significant delay
3	Increased users submit requests simultaneously	25	180	System should handle the load without errors

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
4	Peak load test with multiple simultaneous requests	50	300	Workflow should remain stable and requests should be processed successfully

The Standard Laptop request is placed through **Service Catalog** → **Hardware** → **Standard Laptop** → **Order Now**.

After approval, the workflow creates a Catalog Task with the short description “**Laptop need to Configured**” and assigns it to the **Hardware** assignment group.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status
1	Response Time (Avg)	< 2 seconds	To be measured	Pending
2	Response Time (Max)	< 5 seconds	To be measured	Pending
3	Throughput (Req/sec)	As required by workload	To be measured	Pending
4	Error Rate	< 1%	To be measured	Pending
5	CPU Utilization	< 80%	To be measured	Pending
6	Memory Utilization	< 80%	To be measured	Pending

Note: Actual performance values should be entered from the JMeter/ServiceNow test execution results. The supplied Performance Testing template specifies the response-time, error-rate, CPU and memory targets, but it does not contain actual test measurements.

Step 4: Observations & Analysis

The performance testing focuses on the Standard Laptop procurement workflow. The workflow is triggered through the Service Catalog and automatically creates a Catalog Task after the request is approved.

During testing, the following points should be observed:

1. The Standard Laptop request should be submitted successfully.
2. The approval process should work correctly.

3. After approval, the Catalog Task should be created automatically.
4. The Catalog Task should contain the required short description.
5. The Assignment Group should be updated to **Hardware**.
6. The system should process multiple requests without significant performance degradation.
7. The error rate should remain below the specified target.
8. Response time should remain within the specified limits.

The project documentation confirms that the resulting Catalog Task can be opened to verify its updated status, short description and assigned group.

Overall Observation

The automated workflow reduces manual intervention by automatically generating and assigning the hardware configuration task. This supports the project's objective of improving efficiency and reducing delays in IT procurement.
